

Case(2)
$$x' = -v t'$$
 $x' = 0$ $x' = c t'$

$$-v \xrightarrow{A(-v)} \qquad \bigoplus_{x=0}^{B(0)} \qquad \bigstar \omega$$

$$x = c t$$

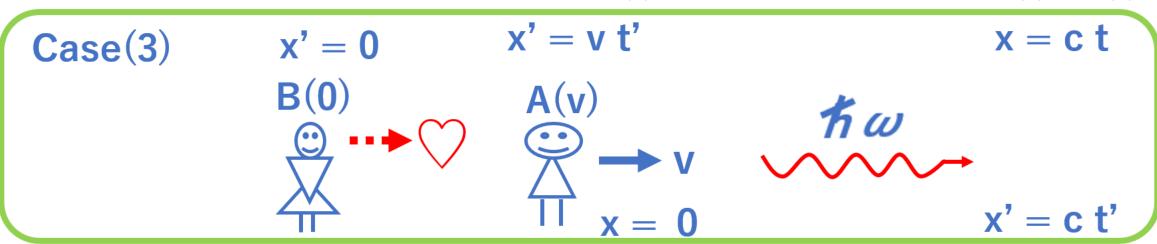

Case(1) and Case (2) describe the same event.

(10) For Case(1) and Case (2) event

$$x' = \beta (x - vt)$$

$$t' = \beta (t - vx/c^2)$$

Case (3) is a different event from Case (1) and (2).

(11)
$$x' = \beta (x + vt)$$

$$t' = \beta (t + vx/c^2)$$

Evchange A and R

Exchange A and B to get Case(1) event

For Case(1) and Case (2) event

$$x = \beta (x' + v t')$$

$$t = \beta (t' + v x'/c^2)$$
